

BEGIN;

```
UPDATE accounts  
SET balance = balance - 100  
WHERE id = 1;
```

Row id=1 is locked.

```
Session 2  
UPDATE accounts  
SET balance = balance + 50  
WHERE id = 1;
```

Session 2 waits.

```
Session 1  
COMMIT;
```

Now Session 2 continues.

This is a lock (or blocking). It's normal and expected.

```
T1 locks Row 1  
T2 waits  
T1 commits
```

T2 proceeds

Deadlock Demo

Session 1:

```
BEGIN;  
UPDATE accounts SET balance=balance+100 WHERE id=1;
```

Session 2:

```
BEGIN;  
UPDATE accounts SET balance=balance+100 WHERE id=2;
```

Session 1:

```
UPDATE accounts SET balance=balance+100 WHERE id=2;
```

Session 2:

```
UPDATE accounts SET balance=balance+100 WHERE id=1;
```

PostgreSQL will raise:

ERROR: deadlock detected

commit or rollback is not done..so deadlock happend
